#### 1. Summary

An air quality modelling study was carried out for Hillingdon, Hounslow and Spelthorne and is described in the report *Air quality modelling for West London: Hillingdon, Hounslow, Spelthorne and Slough*, 27<sup>th</sup> August 2002. A source apportionment study for emissions of NO<sub>x</sub> and PM<sub>10</sub> (*Source apportionment for Hillingdon, Hounslow and Spelthorne*, 17<sup>th</sup> December 2002) showed that emissions from major roads and from Heathrow Airport are of primary concern in the area.

This earlier work, and the scenario testing study described in this report, form part of the Stage 4 Review and Assessment of Air Quality.

This report describes an investigation of the impact on NO<sub>2</sub> concentrations of three emission reduction scenarios. The Emissions Inventory Toolkit, EMIT, has been used to set up the revised emissions scenarios, which have been modelled using the air quality model ADMS-Urban. All sources of emissions and model parameters are as detailed in the earlier reports.

The scenarios investigated here involve reductions in emissions from major roads and from aircraft, as these are the two source groups having the greatest impact on  $NO_2$  concentrations in the area. Modelling has therefore been carried out for a "do-nothing" scenario and for the following three scenarios, all for 2005:

- Scenario 1: Reduction of 50% in airborne aircraft emissions;
- Scenario 2: Reduction of 30% in traffic flows in Hillingdon, Hounslow and Spelthorne; and
- Scenario 3: Low Emission Zone (EURO II).

For each scenario, concentrations of NO<sub>x</sub> and NO<sub>2</sub> have been predicted at each of eleven receptor points at various locations within Hillingdon.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 1 ranges from 1% at Whitehall Infant School and Masson Avenue to 8% at Mendip Close, Bomber Close and Pingleston Close.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 2 ranges from 3% at Coleridge Way, Botwell Primary School, Mendip Close and Bomber Close to 7% at Heathrow Close and the AURN site.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 3 is zero at Coleridge Way, Mendip Close and Whitehall Infant School and 1% at all other receptor locations.

#### 2. Introduction

Cambridge Environmental Research Consultants Ltd (CERC) has been commissioned by the London Boroughs of Hillingdon and Hounslow and the Borough of Spelthorne to carry out a scenario testing study for the area covered by the three boroughs using EMIT and ADMS-Urban. This report describes an investigation of the impact on NO<sub>2</sub> concentrations of three emission reduction scenarios.

An air quality modelling study was carried out for Hillingdon, Hounslow and Spelthorne and is described in the report *Air quality modelling for West London: Hillingdon, Hounslow, Spelthorne and Slough*, 27<sup>th</sup> August 2002. A source apportionment study for emissions of NO<sub>x</sub> and PM<sub>10</sub> (*Source apportionment for Hillingdon, Hounslow and Spelthorne*, 17<sup>th</sup> December 2002) showed that emissions from major roads and from Heathrow Airport are of primary concern in the area.

This earlier work, and the scenario testing study described in this report, form part of the Stage 4 Review and Assessment of Air Quality.

#### 3. Emission Reduction Scenarios

The source apportionment study for emissions of NO<sub>x</sub> and PM<sub>10</sub> (Source apportionment for Hillingdon, Hounslow and Spelthorne, 17<sup>th</sup> December 2002) showed that emissions from major roads and from Heathrow Airport are of primary concern in the area.

The source apportionment results show that the maximum contribution to the total emissions of  $NO_x$  from within Hillingdon is from Heathrow Airport, which contributes 58%. The major contribution to annual average  $NO_x$  concentrations at many locations within Hillingdon is from major roads. However, Heathrow Airport is the major contributor at some locations.

The maximum contribution to the emissions of  $NO_x$  from Heathrow Airport is from airborne aircraft, which contribute 66%. At most locations within Hillingdon, the major contribution to  $NO_x$  concentrations resulting from the airport emissions is from airborne aircraft.

Modelling has therefore been carried out for a "do-nothing" scenario and for the following three scenarios:

- Scenario 1: Reduction of 50% in airborne aircraft emissions;
- Scenario 2: Reduction of 30% in traffic flows; and
- Scenario 3: Low Emission Zone (EURO II).

All emissions data and other parameters are as for the previous studies carried out for this area. All scenarios have been modelled for the year 2005, which is the year by which the Air Quality Strategy Objective values for NO<sub>2</sub> are required to be achieved.

#### 3.1 Receptor Locations

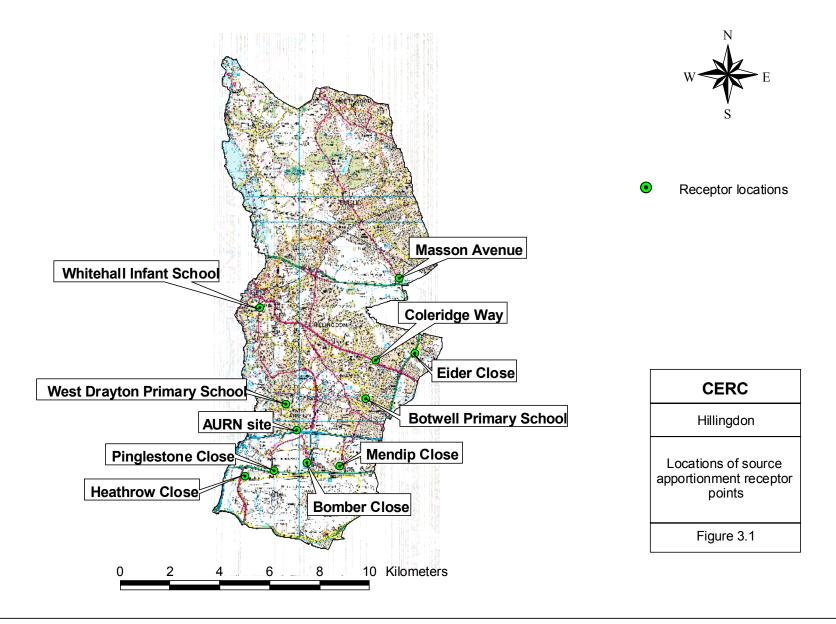

For each scenario, annual average concentrations of both NO<sub>x</sub> and NO<sub>2</sub> have been predicted at each of eleven receptor points, for comparison with results from the "do nothing" scenario.

The receptor point locations are the same as those used for the source apportionment exercise, shown in Figure 3.1. Details of these receptor locations are given in Table 3.1, together with the total annual average NO<sub>2</sub> concentrations predicted at each of the locations for the "do nothing" scenario in the year 2005.

It can be seen from Table 3.1 that, for the "do nothing" scenario, the annual average  $NO_2$  concentrations are predicted to exceed the AQS objective value of  $40\mu g/m^3$  at seven of the eleven receptor points considered.

Table 3.1: Source apportionment receptor point locations within Hillingdon

| ID | Description                 | Location       | Annual average NO <sub>2</sub> concentration |
|----|-----------------------------|----------------|--|
|    |                             |                | (μg/m³)                                      |
| 1  | Masson Avenue               | 511019, 184714 | 39.3   |
| 2  | Eider Close                 | 511642, 181709 | 40.4   |
| 3  | Coleridge Way               | 510073, 181410 | 35.4   |
| 4  | Botwell Primary School      | 509681, 179870 | 40.5   |
| 5  | Mendip Close                | 508640, 177199 | 47.0   |
| 6  | Bomber Close                | 507307, 177301 | 45.0   |
| 7  | Pinglestone Close           | 505996, 177006 | 45.6   |
| 8  | Heathrow Close              | 504842, 176789 | 42.1   |
| 9  | West Drayton Primary School | 506473, 179674 | 37.7   |
| 10 | AURN site                   | 506900, 178620 | 51.9   |
| 11 | Whitehall Infant School     | 505432, 183532 | 36.8   |

#### 4. Emission Reduction Scenario Results

For each scenario, annual average concentrations of both  $NO_x$  and  $NO_2$  have been predicted at each of the eleven receptor points presented in Section 3.1, for comparison with results from the "do nothing" scenario. The predicted reduction in concentrations, in  $\mu g/m^3$  and as a percentage, is also presented in each case. Note that the reductions in  $NO_2$  concentrations are smaller than those for  $NO_x$  because of the  $NO_x$  chemistry taking place. The predicted  $NO_x$  and  $NO_2$  concentrations for the "do nothing" and each emission reduction scenario are shown in Figures 4.1 and 4.2.

#### 4.1 Scenario 1: Reduction of 50% in airborne aircraft emissions

The predicted annual average concentrations of  $NO_x$  and  $NO_2$  for Scenario 1 are presented in Tables 4.1a and 4.1b, respectively.

Table 4.1a: Predicted annual average  $NO_x$  concentrations for "do nothing" and Scenario 1

|                             | Annual average NO <sub>x</sub> concentration (μg/m³) |            |            |             |
|-----------------------------|--|------------|------------|-------------|
|                             | Existing   | Scenario 1 | Difference | % reduction |
| Masson Avenue               | 54.9   | 53.8       | 1.0        | 2           |
| Eider Close                 | 58.0   | 56.5       | 1.5        | 3           |
| Coleridge Way               | 47.0   | 45.3       | 1.7        | 4           |
| Botwell Primary School      | 55.5   | 53.1       | 2.4        | 4           |
| Mendip Close                | 68.5   | 60.2       | 8.3        | 12          |
| Bomber Close                | 65.1   | 57.8       | 7.3        | 11          |
| Pinglestone Close           | 67.7   | 59.9       | 7.8        | 12          |
| Heathrow Close              | 62.4   | 57.7       | 4.7        | 8           |
| West Drayton Primary School | 51.1   | 48.9       | 2.1        | 4           |
| AURN site                   | 96.6   | 93.6       | 3.0        | 3           |
| Whitehall Infant School     | 49.7   | 48.9       | 0.8        | 2           |

Table 4.1b: Predicted annual average NO<sub>2</sub> concentrations for "do nothing" and Scenario 1

|                             | Annual average NO <sub>2</sub> concentration (μg/m³) |            |            |             |
|-----------------------------|--|------------|------------|-------------|
|                             | Existing   | Scenario 1 | Difference | % reduction |
| Masson Avenue               | 39.3   | 38.8       | 0.5        | 1           |
| Eider Close                 | 40.4   | 39.6       | 0.7        | 2           |
| Coleridge Way               | 35.4   | 34.4       | 1.0        | 3           |
| Botwell Primary School      | 40.5   | 39.2       | 1.3        | 3           |
| Mendip Close                | 47.0   | 43.1       | 4.0        | 8           |
| Bomber Close                | 45.0   | 41.3       | 3.7        | 8           |
| Pinglestone Close           | 45.6   | 41.9       | 3.7        | 8           |
| Heathrow Close              | 42.1   | 39.8       | 2.3        | 5           |
| West Drayton Primary School | 37.7   | 36.5       | 1.2        | 3           |
| AURN site                   | 51.9   | 50.8       | 1.1        | 2           |
| Whitehall Infant School     | 36.8   | 36.4       | 0.4        | 1           |

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 1 ranges from 1% at Whitehall Infant School and Masson Avenue to 8% at Mendip Close, Bomber Close and Pingleston Close.

#### 4.2 Scenario 2: Reduction in traffic flows by 30%

The predicted annual average concentrations of  $NO_x$  and  $NO_2$  for Scenario 2 are presented in Tables 4.2a and 4.2b, respectively.

Table 4.2a: Predicted annual average NO<sub>x</sub> concentrations for "do nothing" and Scenario 2

|                             | Annual average NO <sub>x</sub> concentration (μg/m³) |            |            |             |
|-----------------------------|--|------------|------------|-------------|
|                             | Existing   | Scenario 2 | Difference | % reduction |
| Masson Avenue               | 54.9   | 49.6       | 5.3        | 10          |
| Eider Close                 | 58.0   | 52.6       | 5.3        | 9           |
| Coleridge Way               | 47.0   | 44.9       | 2.2        | 5           |
| Botwell Primary School      | 55.5   | 52.8       | 2.7        | 5           |
| Mendip Close                | 68.5   | 65.1       | 3.4        | 5           |
| Bomber Close                | 65.1   | 61.3       | 3.7        | 6           |
| Pinglestone Close           | 67.7   | 62.5       | 5.2        | 8           |
| Heathrow Close              | 62.4   | 56.1       | 6.3        | 10          |
| West Drayton Primary School | 51.1   | 47.8       | 3.2        | 6           |
| AURN site                   | 96.6   | 81.1       | 15.5       | 16          |
| Whitehall Infant School     | 49.7   | 46.7       | 3.1        | 6           |

Table 4.2b: Predicted annual average NO<sub>2</sub> concentrations for "do nothing" and Scenario 2

|                             | Annual average NO <sub>2</sub> concentration (μg/m³) |            |            |             |
|-----------------------------|--|------------|------------|-------------|
|                             | Existing   | Scenario 2 | Difference | % reduction |
| Masson Avenue               | 39.3   | 36.9       | 2.5        | 6           |
| Eider Close                 | 40.4   | 38.2       | 2.2        | 5           |
| Coleridge Way               | 35.4   | 34.3       | 1.1        | 3           |
| Botwell Primary School      | 40.5   | 39.3       | 1.3        | 3           |
| Mendip Close                | 47.0   | 45.8       | 1.2        | 3           |
| Bomber Close                | 45.0   | 43.5       | 1.5        | 3           |
| Pinglestone Close           | 45.6   | 43.6       | 2.0        | 5           |
| Heathrow Close              | 42.1   | 39.3       | 2.8        | 7           |
| West Drayton Primary School | 37.7   | 36.0       | 1.6        | 4           |
| AURN site                   | 51.9   | 48.6       | 3.4        | 7           |
| Whitehall Infant School     | 36.8   | 35.4       | 1.5        | 4           |

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 2 ranges from 3% at Coleridge Way, Botwell Primary School, Mendip Close and Bomber Close to 7% at Heathrow Close and the AURN site.

#### 4.3 Scenario 3: Low Emission Zone (EURO II)

For the purposes of this modelling a Low Emission Zone (LEZ) has been set up from which certain vehicle types are excluded. All vehicles (excluding private cars) with engines which do not meet the standard of EURO II with particulate traps have been excluded from Hillingdon and Hounslow. The total number of vehicles has been assumed to remain the same.

The predicted annual average concentrations of  $NO_x$  and  $NO_2$  for scenario 3 are presented in Tables 4.3a and 4.3b, respectively.

Table 4.3a: Predicted annual average NO<sub>x</sub> concentrations for "do nothing" and Scenario 3

|                             | Annual average NO <sub>x</sub> concentration (μg/m³) |            |            |             |
|-----------------------------|--|------------|------------|-------------|
|                             | Existing   | Scenario 2 | Difference | % reduction |
| Masson Avenue               | 54.9   | 54.4       | 0.5        | 1           |
| Eider Close                 | 58.0   | 57.1       | 0.8        | 1           |

#### 10. Discussion

An air quality modelling study was carried out for Hillingdon, Hounslow and Spelthorne and is described in the report *Air quality modelling for West London: Hillingdon, Hounslow, Spelthorne and Slough*, 27<sup>th</sup> August 2002. A source apportionment study for emissions of NO<sub>x</sub> and PM<sub>10</sub> (*Source apportionment for Hillingdon, Hounslow and Spelthorne*, 17<sup>th</sup> December 2002) showed that emissions from major roads and from Heathrow Airport are of primary concern in the area.

This earlier work, and the scenario testing study described in this report, form part of the Stage 4 Review and Assessment of Air Quality.

This report describes an investigation of the impact on NO<sub>2</sub> concentrations of three emission reduction scenarios. The Emissions Inventory Toolkit, EMIT, has been used to set up the revised emissions scenarios, which have been modelled using the air quality model ADMS-Urban. All sources of emissions and model parameters are as detailed in the earlier reports.

The scenarios investigated here involve reductions in emissions from major roads and from aircraft, as these are the two source groups having the greatest impact on NO<sub>2</sub> concentrations in the area. Modelling has therefore been carried out for a "do-nothing" scenario and for the following three scenarios, all for 2005:

- Scenario 1: Reduction of 50% in airborne aircraft emissions;
- Scenario 2: Reduction of 30% in traffic flows in Hillingdon, Hounslow and Spelthorne; and
- Scenario 3: Low Emission Zone (EURO II).

For each scenario, concentrations of NO<sub>x</sub> and NO<sub>2</sub> have been predicted at each of eleven receptor points at various locations within Hillingdon.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 1 ranges from 1% at Whitehall Infant School and Masson Avenue to 8% at Mendip Close, Bomber Close and Pingleston Close.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 2 ranges from 3% at Coleridge Way, Botwell Primary School, Mendip Close and Bomber Close to 7% at Heathrow Close and the AURN site.

The predicted reduction in annual average NO<sub>2</sub> concentrations due to Scenario 3 is zero at Coleridge Way, Mendip Close and Whitehall Infant School and 1% at all other receptor locations.
